VPOS Cashier System Update Guide

How to check for, prepare, and install a VPOS Desktop update safely.

Before you update: Finish the current sale, make sure the workstation has internet access, and close the cashier shift when operationally possible. Never turn off the computer while an update is installing.

Quick update steps

1

Open Settings

In VPOS Desktop, select **Settings**. Find the **Software Update** card named **Desktop OTA**.

2

Check for an update

Select **Check for Updates**. Wait for the latest-version result and release notes.

3

Make the workstation ready

Confirm **Install Safety** says **Ready**. If it says **Action Needed**, synchronize the pending records first.

4

Install and restart

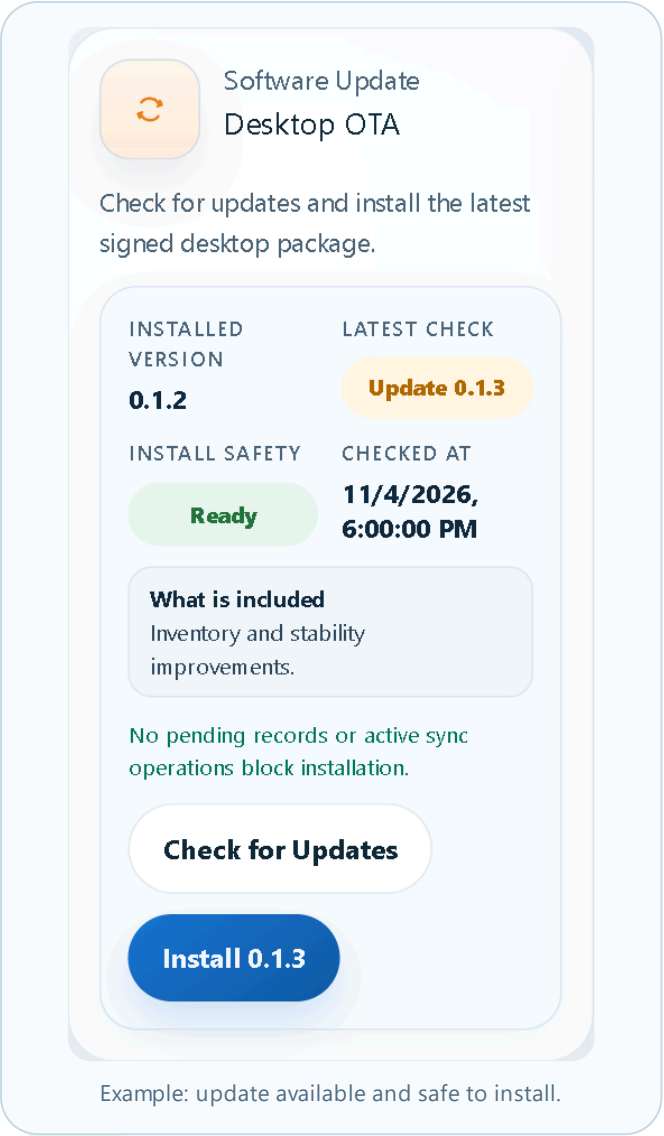

Select **Install [version]**. Allow the download, verification, installation, and restart to finish.

What the update keeps

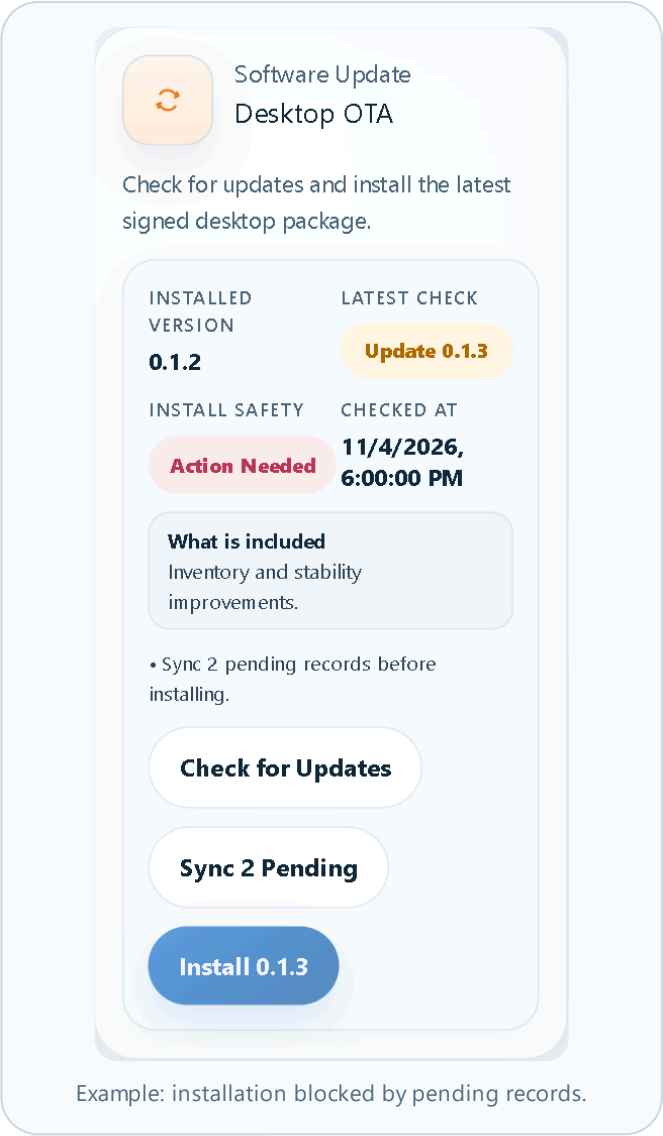

- Branch, location, cashier, printer, and device settings stay on the workstation.
- Local sales and pending synchronization records are not intentionally deleted by the update.
- VPOS verifies the update signature before installation.

Best time to update: after pending records are synchronized and the cashier shift is closed.

Understand the update screen

Example: update available and safe to install.

Example: installation blocked by pending records.

Ready

1. Review the **Installed Version**, available version, and release notes.
2. Select **Check for Updates** again if the result is old.
3. Select **Install [version]**.
4. Wait for VPOS to restart. Do not force-close the program.

Action Needed

1. Select **Sync [number] Pending**.
2. Wait until synchronization finishes and the top status shows that records are synced.
3. Select **Check for Updates** again.
4. Install only when **Install Safety** changes to **Ready**.

After VPOS restarts

Confirm the version

Open **Settings > Desktop OTA** and confirm **Installed Version** shows the new version.

Confirm workstation setup

Check the branch, location, cashier identity, printer, and receipt settings.

Synchronize

Select **Sync Now** and wait for the workstation to show that it is fully synchronized.

Do a quick check

Perform a test print. On a pilot workstation, complete a small test transaction according to store procedure.

If something goes wrong

What you see	What to do
Check failed	Check the internet connection, then select **Check for Updates** again. If it still fails, contact the supervisor or system administrator.
Action Needed	Select **Sync [number] Pending**. Finish any active transaction and wait for synchronization to complete.
Shift Open	Close the cashier shift before updating when possible. If VPOS asks for confirmation, follow the supervisor's instruction.
Installation failed	Do not repeatedly force-close VPOS or delete local files. Record the message, keep the workstation powered on, and contact support.
VPOS does not reopen	Wait one minute, then open VPOS Desktop once. If it still does not start, contact support and report the old and new version numbers.

Important: Do not download an installer from an unofficial link, bypass signature warnings, uninstall VPOS, or delete the VPOS data folder unless an authorized administrator instructs you to do so.
